PROCEDURE FOR RECHARGING CARBON FILTER

1. Advance regeneration knob clock-wise to back-wash position (1 click.) Plunger will be all the way in. Allow unit to back-wash for (2) minutes.
2. Advance regeneration knob clock-wise to draw position (1 more click.) Plunger will be ½ way out.
3. Place draw tube in one (1) galloon of pool shock or 7% peroxide. Open shut-off valve on draw tube. Allow full gallon of pool shock or 7% peroxide to be drawn into filter.
4. Quickly move draw tube to container of about one (1) quart of clear water and let it draw out.
5. Just before container is empty, close shut off valve on draw tube. This avoids drawing of air.
6. Let unit continue its regeneration cycle. Filter will return to service position and will cycle at its regular time.
7. Be sure the correct time is set on timer. Recharging is complete.
